

# BASICS OF MATRICES

Dr. Anandhama Dutt Jauhari

The word matrix was introduced first by Cayley in 1860. It means rectangular arrangement of any numbers, arranged in  $m$  rows and  $n$  column.

$$A = [a_{ij}]_{m \times n}$$

entries or elements.

\* Application - In solution of system of linear Equ.  
Probability, mathematical economics,  
electrical network, Quantum mechanics,  
transportation problems, matrix are very  
amenable for computers.

\* Sum (Difference)  $\rightarrow C = A \pm B$   
where  $[c_{ij}] = [a_{ij}] \pm [b_{ij}]$   
where  $A$  and  $B$  are of same  
order.

\* Equality - Two matrices  $A$  and  $B$  are equal if  
they are of same order.  $a_{ij} = b_{ij}$ .

\* Transpose of matrix  $A_{m \times n}$  is denoted by  $A^T_{n \times m}$   
obtained by interchanging rows and column.  
 $(AB)^T = B^T A^T$

\* Square Matrix - If  $m = n$  (No. of rows = No. of column)  
then it is said to be square matrix.  
The elements  $a_{ii}$  are known as diagonal  
elements.

\* Null or Zero matrix is a matrix with all  
elements zero.

\* Trace  $\sum_{i=1}^n a_{ii}$  = Sum of diagonal elements.

\* Singular Matrix; if  $|A| = 0$

\* Nonsingular Matrix; if  $|A| \neq 0$

\* Upper triangular Matrix; if  $a_{ij} = 0$   $i > j$

\* Lower triangular Matrix; if  $a_{ij} = 0$   $i < j$

\* Diagonal Matrix;  $a_{ij} = 0$  where  $i \neq j$

\* Scalar Matrix; A diagonal matrix with  $a_{ii} = k$  for  
every  $i$  and  $k$  is constant.

\* Identity Matrix; with all diagonal elements unity.

for Square Matrix

Dr. Anandhara Dutt Taulari

\* Row matrix - Row matrix is a matrix having one row.

\* Column matrix - Column matrix is a matrix having one column.

\* Power of matrix;  $A^n$  is a matrix obtained by multiplying  $A$  by itself  $n$  times.

### INVERSE OF MATRIX -

Inverse of  $n$ -square matrix  $A$  is denoted by  $A^{-1}$  and is defined such that  $AA^{-1} = A^{-1}A = I$ .

\* Inverse of  $A$  exists only if  $|A| \neq 0$ .

\* Inverse of matrix is unique.

\* Inverse of a product is the product in reverse order.

$$(AB)^{-1} = B^{-1}A^{-1}$$

\* For Diagonal matrix  $D$  with diag as  $d_1, d_2, \dots, d_n$ ,  $D^{-1}$  is a diagonal matrix with reciprocals  $\frac{1}{d_1}, \frac{1}{d_2}, \dots, \frac{1}{d_n}$  as diagonal elements.

\* Transposition and Inverse are Commutative.

$$(A^{-1})^{-1} = A$$

### ADJOINT OF MATRIX -

Adjoint of a matrix is denoted by  $\text{adj } A$  and is the transpose of  $n$ -square matrix  $[A_{ij}]$  where  $A_{ij}$  are the cofactors of  $a_{ij}$  of  $A$ .

$$\text{adj } A = \begin{bmatrix} A_{11} & A_{12} & \dots & A_{1n} \\ A_{21} & A_{22} & \dots & A_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ A_{n1} & A_{n2} & \dots & A_{nn} \end{bmatrix}$$

$$\text{adj } AB = (\text{adj } A)(\text{adj } B)$$

$$A^{-1} = \frac{\text{adj } A}{|A|}$$

Idempotent matrix -  $A^2 = A$

Dr. Anadhana Dutt Jha

Ex.  $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

Involutory matrix -  $A^2 = I$

Ex.  $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

Orthogonal matrix -  $A'A = AA' = I$

Unitary matrix - A square matrix is said to be unitary matrix if  $AA^* = A^*A = I$

Show that every square matrix can be uniquely expressed as sum of a symmetric and skew symm. matrices.

Let  $A = [a_{ij}]$

$$A = \frac{1}{2}(A+A') + \frac{1}{2}(A-A')$$

Let  $P = \frac{1}{2}(A+A')$ ,  $Q = \frac{1}{2}(A-A')$

$$A = P + Q$$

$$P' = \frac{1}{2}(A+A')' = \frac{(A'+A)}{2} = P$$

$$Q' = \left[\frac{1}{2}(A-A')\right]' = \frac{1}{2}(A'-A) = -\frac{1}{2}(A-A') = -Q$$

$\Rightarrow \boxed{A = \text{Sym. matrix} + \text{skew sym. matrix}}$
